## Sustainable site selection & site management

Webinar | November 16, 2023

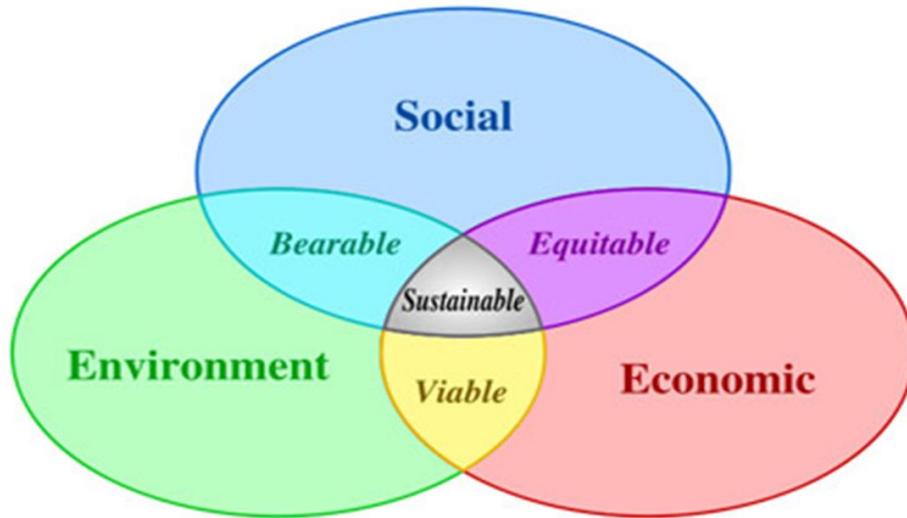

# Terms & Definitions

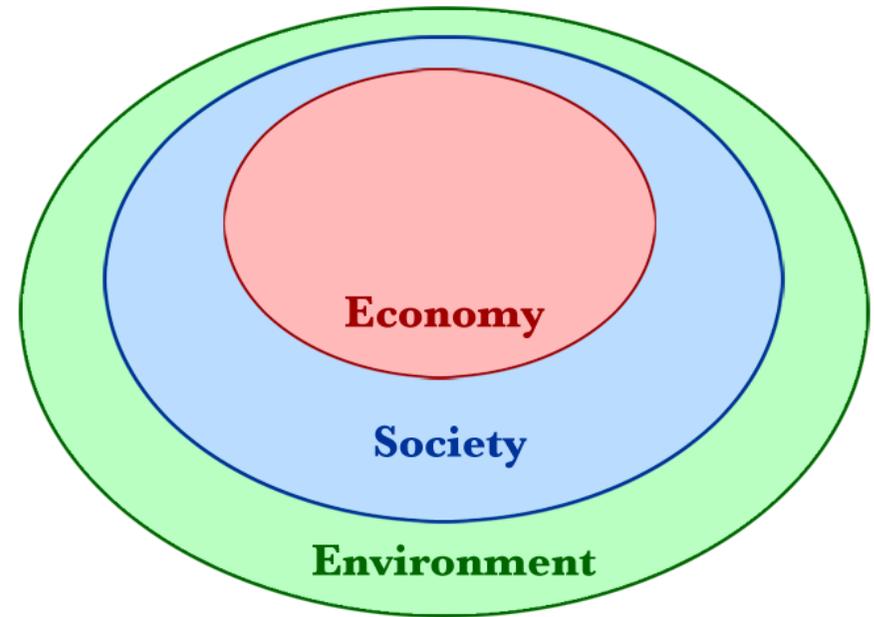

# Sustainability

“Development that meets the needs of the present without compromising the ability of future generations to meet their own needs“.

Source: United Nations commission’s 1987 report, Our Common Future.

Sustainability (based on “Three Pillars” or “Triple Bottom Line”)

Sustainability (nested – “real life”)

# Brownfield

According to the U.S. EPA, “brownfields” are “real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contamination.”

**Brownfields are basically a real estate transaction with an environmental component.**

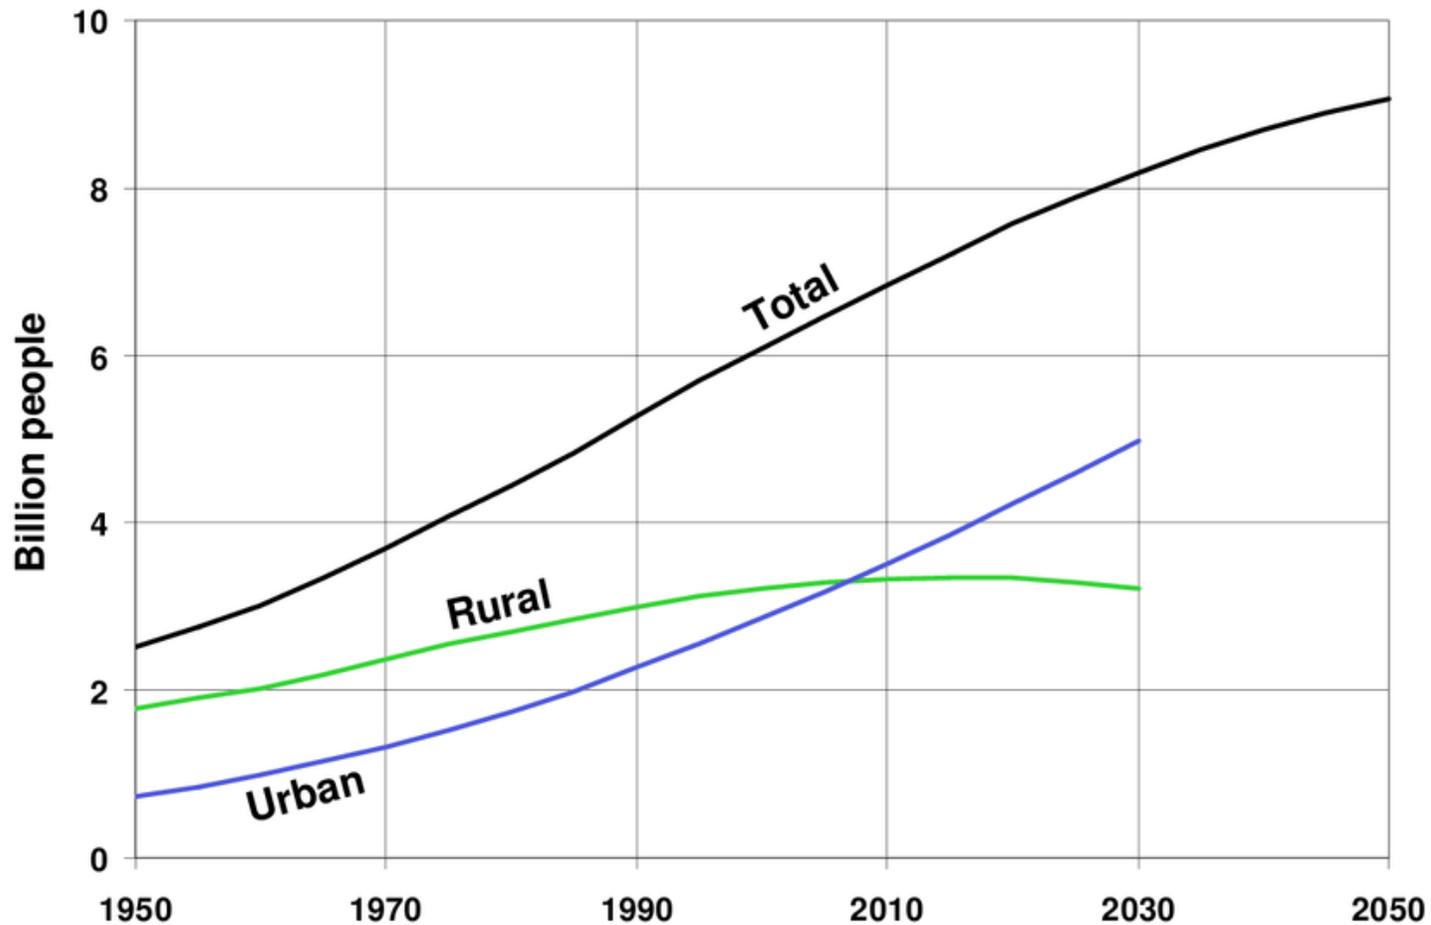

# Why Sustainable Site Selection?

# Reclaim & Reuse

“The reclamation and reuse of Brownfield sites is a core component of Sustainable Development. It integrates a wide range of economic, social and environmental objectives. Brownfield redevelopment not only cleans up environmental health hazards and eyesores; it is also a catalyst for community regeneration, particularly when communities are brought into the consultation process of site identification and restoration. Managed effectively as a sustainable redevelopment scheme, Brownfield sites provide affordable housing, create opportunities for employment, promote conservation and wildlife, and offer a shared place for play and enjoyment. Above all, the transformation of a Brownfield site is a vision of hope for the future.”

Source: [www.sustainablebuild.co.uk](http://www.sustainablebuild.co.uk)

Historical and projected world population, 1950-2050, and rural-urban populations (from FAOSTAT online, November 2008)

# Urbanization

**1900** | 2 out of every 10 people lived in an urban area

**1990** | 4 out of every 10 people lived in an urban area

**2010** | 5 out of every 10 people lived in an urban area

**2030** | 6 out of every 10 people will live in an urban area

**2050** | 7 out of every 10 people will live in an urban area

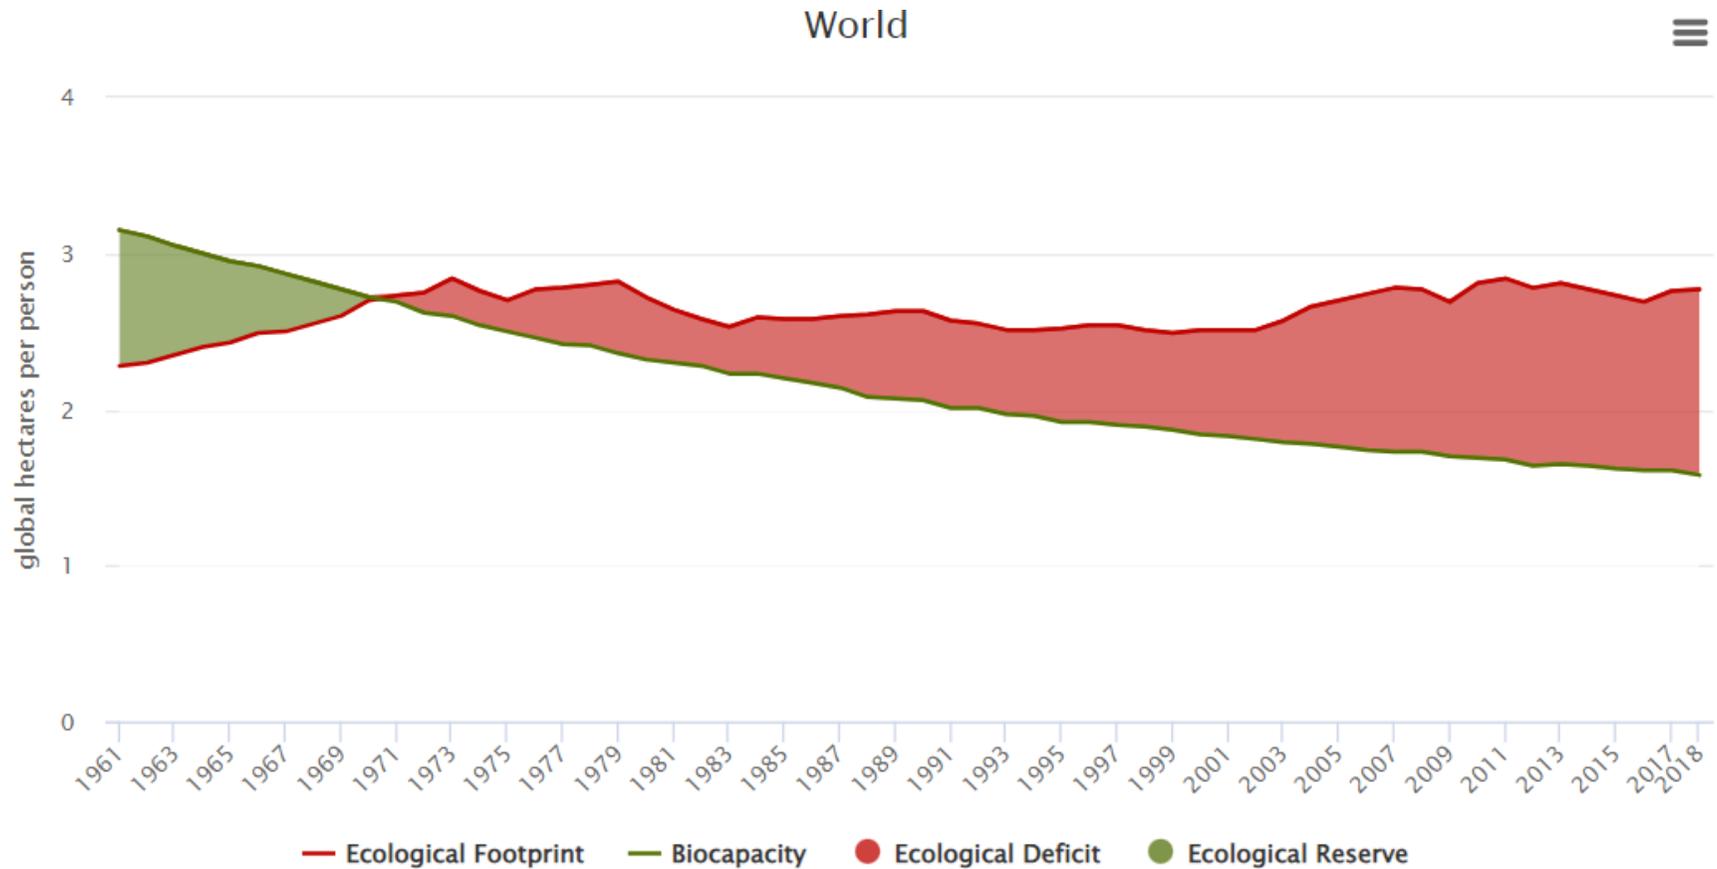

# Numbers game

- Surface of the Earth: ~510,100,000 km<sup>2</sup>
- Biologically productive land and water 2019: ~122,000,000 km<sup>2</sup>
- World Population: 8,000,000,000 people
- Biocapacity per Person 2018: 15,800 m<sup>2</sup>  
125 x 125 m - surface for animals not deducted!
- Ecological Footprint <sup>\*)</sup> per Person 2018: 27,700 m<sup>2</sup>  
<sup>\*)</sup> food, living, mobility, consumption = required surface

**Required surface almost double of available surface!**

# Ecological Deficit

Global Footprint Network, 2022 National Footprint and Biocapacity Accounts

# Legal, Technical & Financial Background

 **SUSTAINABLE DEVELOPMENT GOALS**

# SGD 15

- Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss
- 15.3 By 2030, combat desertification, restore degraded land and soil, including land affected by desertification, drought and floods, and strive to achieve a land degradation-neutral world

# EU Taxonomy

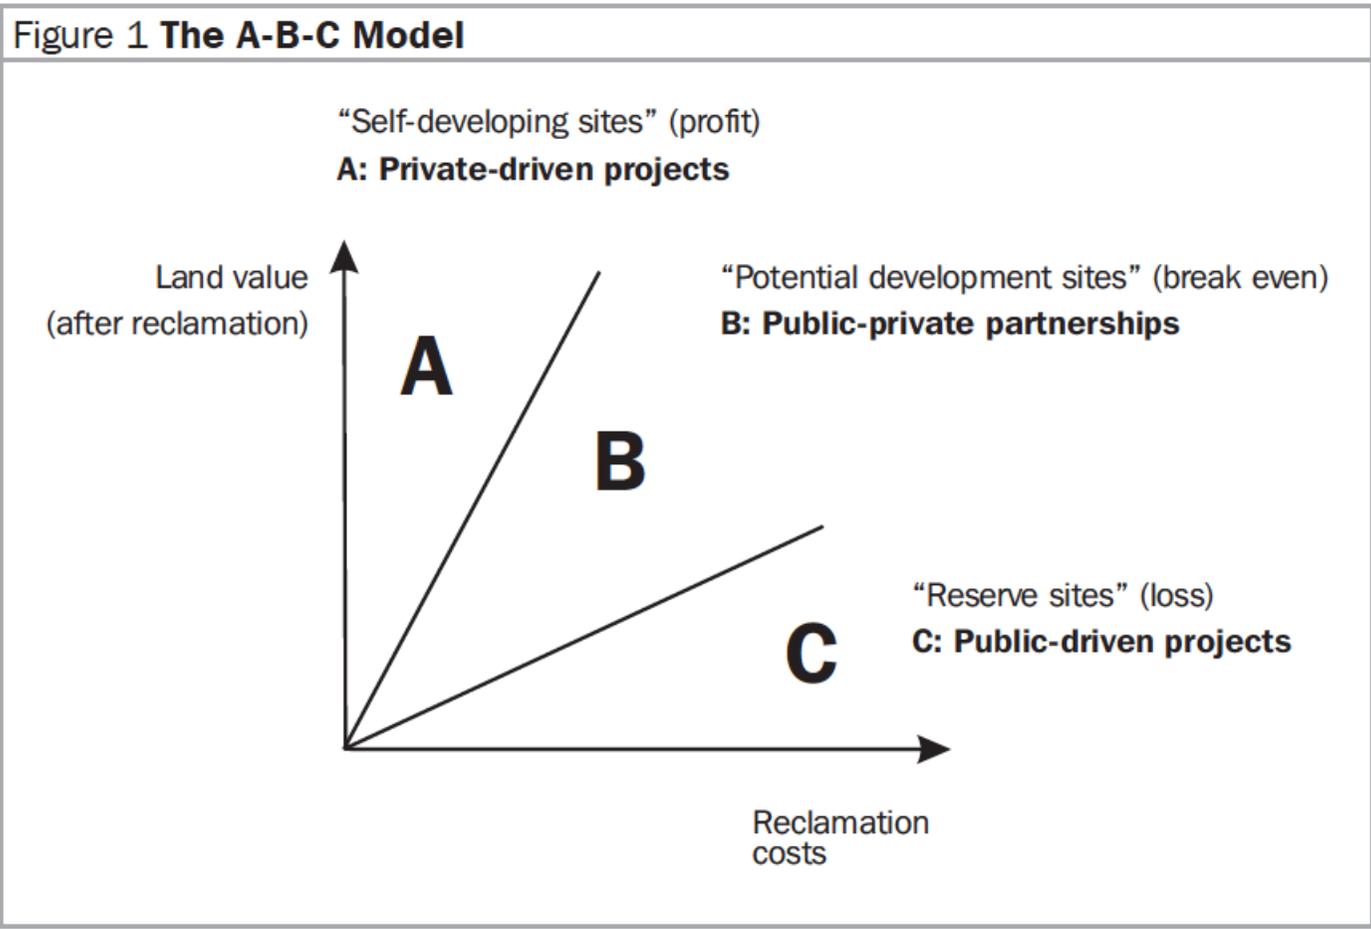

- The Taxonomy Regulation was published on 22 June 2020 and entered into force on 12 July 2020
- The Taxonomy Regulation establishes six environmental objectives
  1. Climate change mitigation
  2. Climate change adaptation
  3. The sustainable use and protection of water and marine resources
  4. The transition to a circular economy
  5. Pollution prevention and control
  6. The protection and restoration of biodiversity and ecosystems

# EU Taxonomy cont.

How are sustainable economic activities defined?

An activity must:

1. Contribute to at least one of six environmental objectives listed in the Taxonomy; and
2. Do no significant harm to any of the other objectives, while respecting basic human rights and labor standards.

Categorization of Brownfield Sites

# EU Funding Instruments

Funding instruments	
European Regional Development Fund	For the sustainable development and structural adjustment of regional economies
Cohesion Fund	Aims to decrease the differences between the EU's regional economic development, focusing on improving the urban environment, decontaminating brownfield sites and reducing air pollution
LIFE+ programe	The EU's funding instrument for environment and climate actions
Horizon 2020 actions	A funding mechanism for pan-European projects
Common agricultural policy	Set of legislation and practices adopted to provide a common, unified policy on agriculture
European Social Fund	The EU's main financial instrument for supporting employment in the Member States

# Legal & Financial Challenges

- No international or EU brownfield policy
- Lack of proper tax incentives
- Unclear legal and regulatory policies towards remediation and investigations
- Potential liability issues in the future
- Lack of local expertise with creative remediation solutions in an urban environment

# Site Challenges

- Lack of Available Site Information
- Environmental Contamination
- Surface Structures
- Subsurface Structures
- Underground Utilities
- Unsuitable Soils

# Liability, Costs & Time

# Environmental Liability

- The liable entity is either the polluter or the holder of the land.
- The exact extent of the liability is further marked by uncertainty, because of the unknown degree of contamination, in the absence of a contamination assessment studies data base.

# Remediation Costs

- Clean-up costs can reach very burdensome amounts.
- Costs cannot be easily and precisely predetermined because of:
  - vast surface area Brownfield sites usually occupy and
  - unknown degree of contamination.

# Remediation Costs (cont.)

- Clean-up costs are to be borne by the entity that generated the pollution or
- Clean-up costs are to be borne by the current holder of the plot of land in question for both historical and current pollution.
- Moreover, plots of land neighbouring the contaminated site which were affected by pollution are also the financial liability of the entity that generated the pollution on the contaminated site.

# Remediation Costs - Solutions

- Property tax incentives for a determined period after the site has been clean-up and developed
- Further capital gain tax exemption for developers remediating contaminated sites
- Government could initiate collaboration with banks to encourage them to offer loans at subsidized rates for private investors looking to develop a brownfield site
- Public authorities could create a revolving loan fund: once the initial loan is paid back, new projects can be financed

# Time

- Remediation can take a long time to be performed
- Many times, remediation takes longer than initially projected, exceeding the estimated budget
- Causes, e.g.:
  - lack of exact information regarding degree and type of contamination
  - unforeseen issues arising during remediation
  - lack of expertise in dealing with such issues

# Time - Solutions

- Fast track permitting – brownfield projects should benefit from a significantly shorter permitting process
- Authorities could initiate partnerships with foreign environmental agencies, for the latter to offer their expertise in connection with brownfield redevelopment

# Sustainable Site Management

# Storm Water Runoff – Erosion Protection

# Storm Water Runoff – Erosion Protection

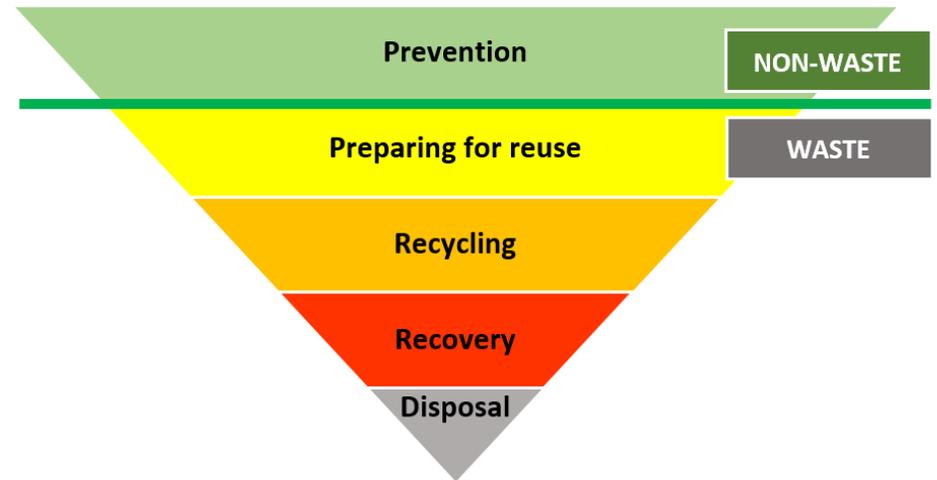

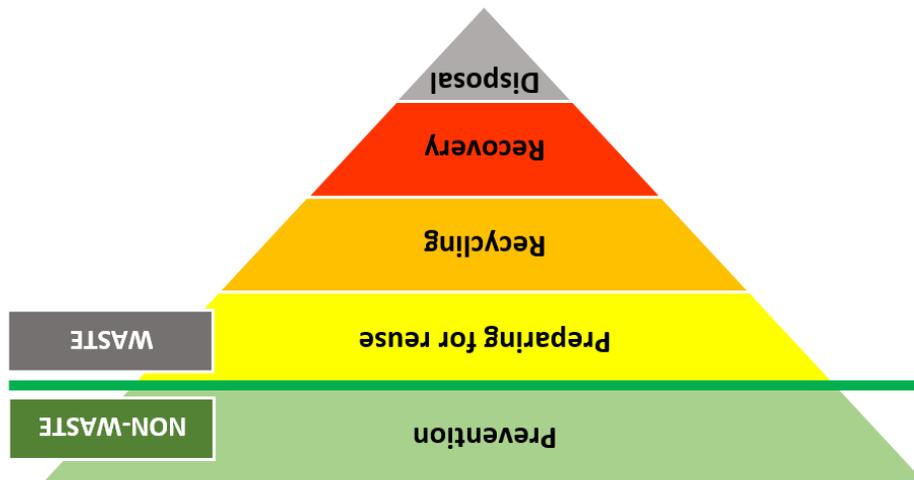

# Storm Water Management

# Waste Management Hierarchy (Pyramid)

# Alternative Transportation

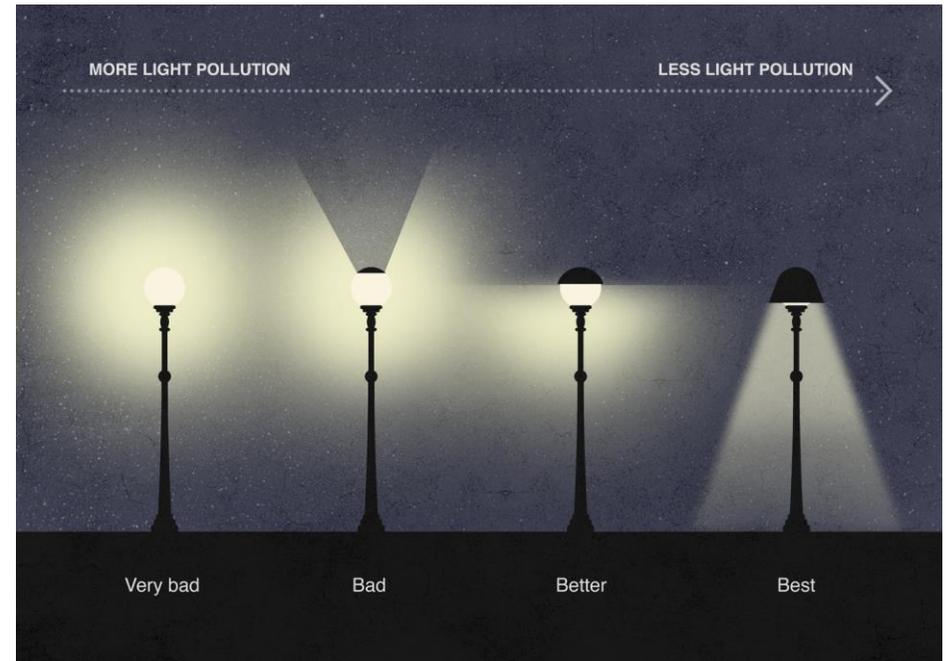

# Urban Heat Island Effect

# Light Pollution

- Eliminate light projecting offsite & reduce the height of light fixtures
- Light on-site only areas necessary
- Minimize light from buildings (lighting control/shading)

# Sustainable Site Solutions

# Case Study #1 – Aramark (Source: Epstein)

- Location
  - Chicago, Illinois
- Type
  - Light Industrial – Commercial Laundry
- Site Area
  - 5.4 Ha (13.4 Acres)
- Building Area
  - 14,958 sm (161,000 sq ft)
- Employment / Operation
  - 300+ jobs / 24/7 Processing 500mt/wk
- Site History
  - International Amphitheatre
  - Built 1935 – Demolished Late 1990s
  - Large Exhibition Hall with Heavy Structure
  - Open Central Hall – Columned Side Halls

## Case Study #1 – Aramark

# Case Study #1 - Aramark (Source: Epstein)

- Site Challenges

- Surface Contaminated Soils
  - PCBs from Elec. Transformer Oil
  - Dumped Waste Oil on Site
- Extensive Sewer Vaults & Tunnels at Site Perimeter
- Multiple Concrete Foundations at Side Halls
- Large Concrete Foundation at Main Hall
- Surface Concrete Pavement

- Site Solutions

- Surface Contaminated Soils
  - Tested & Defined Area of Contamination
  - Removed & Disposed Off-Site
- Surface Concrete Pavement
  - Stripped from Surface
  - Crushed On-Site for Parking Base
- Sewer Vaults & Tunnels
  - Avoided Perimeters of Site
  - Avoided Utility Locations
- Concrete Foundations
  - Planned Buildings in Clear Zone so as to not interfere or remove
  - Placed Parking over Foundations - no removal required

# Case Study #2 – Triumph Foods (Source: Epstein)

- Location
  - St. Joseph, Missouri
- Type
  - Industrial – Meat Processing (Pork)
- Site Area
  - 24.3 Ha (60 Acres)
- Building Area
  - 58,066 sm (625,000 sq ft)
- Employment / Operation
  - 1200+ jobs / 24/7 Process 19,000 pigs/day
- Site History
  - Originally Part of Missouri River Flood
  - Plain
  - Multiple Meat Processing Buildings
  - Previously
  - Demolished Building Foundations from 1900s – Bldg Fire
  - On North End Former Meat Plant from 60s & 70s era
  - Site abandoned for approx. 8 years

- Site Challenges
  - Unsuitable Soils
    - River Bottom Silty Soil
    - Fire Debris
    - Old Demolition Debris
  - Extensive Old Buried Foundations
  - Multiple Existing Buildings
  - Surface Concrete Pavement
  - High Water Table from River
- Site Solutions
  - Existing Buildings
    - Demolished all but one
    - Crushed all Concrete & Reused
  - Surface Concrete Pavement
    - Stripped from Surface
    - Crushed On-Site for Parking Base
  - Concrete Foundations
    - Planned Buildings in Clear Zone so as to not interfere or remove
    - Placed Parking over Foundations - no removal required
    - Saw-cut and selectively removed where needed for Buildings or Utilities

# Case Study #3 – Testa Produce (Source: Epstein)

- Location
  - Chicago, Illinois
- Type
  - Light Industrial – Refrigerated Produce Distribution
- Site Area
  - 5.2 Ha (12.86 Acres)
- Building Area
  - 8,482 sm (91,300 sq ft)
- Employment / Operation
  - 200+ jobs / 24/7
- Other
  - Create GREEN Facility
  - LEED Platinum Certification
- Site History
  - Old Manufacturing Site
  - Buildings Demolished
  - Used Recently as Parking for Trucks & Trailer/Container Storage
  - Incentives from City for Redevelopment
  - Shorter Permit Process for LEED Building

# Case Study #3 – Testa Produce (Source: Epstein)

- Site Challenges
  - Many Previous Uses
  - Contaminated Soils
    - Lead
    - Arsenic
    - Chromium
  - Cinders, Brick, RR Ties & Misc. Debris
  - Surface Concrete Pavement
- Site Solutions
  - Contaminated Soils
    - Stripped & Stockpiled
    - Buried in Borrow Pit
    - Capped with 1m of clay
  - Surface Concrete Pavement
    - Stripped from Surface
    - Crushed On-Site for Parking Base
  - Misc. Debris Placed in Borrow Pit
  - Some Materials Reclaimed & Used on Site

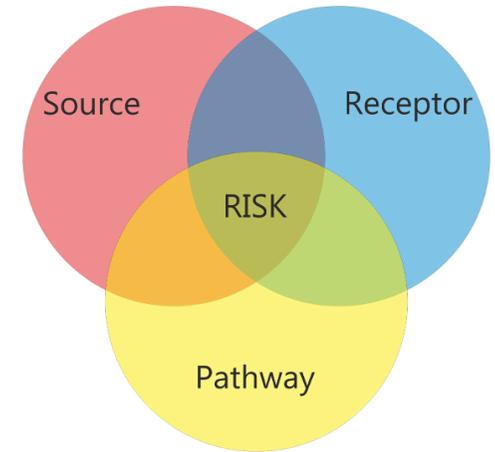

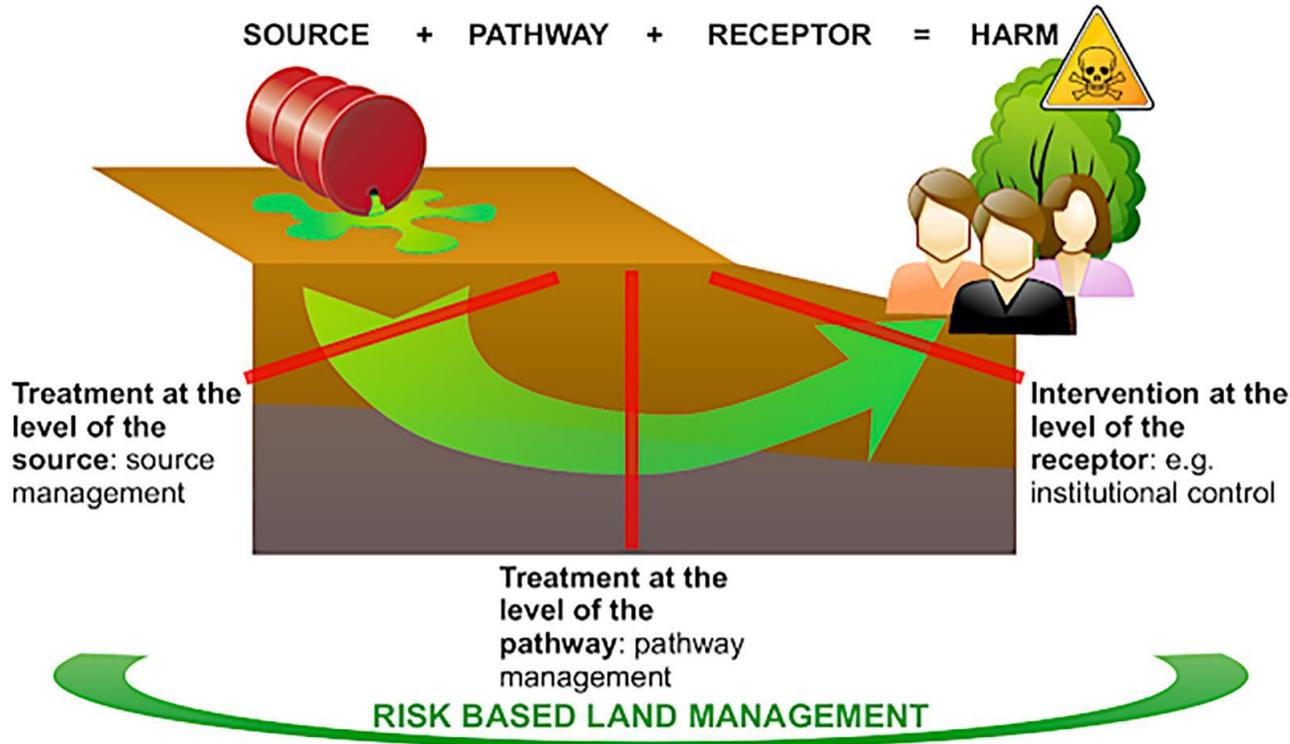

# Sustainable Remediation

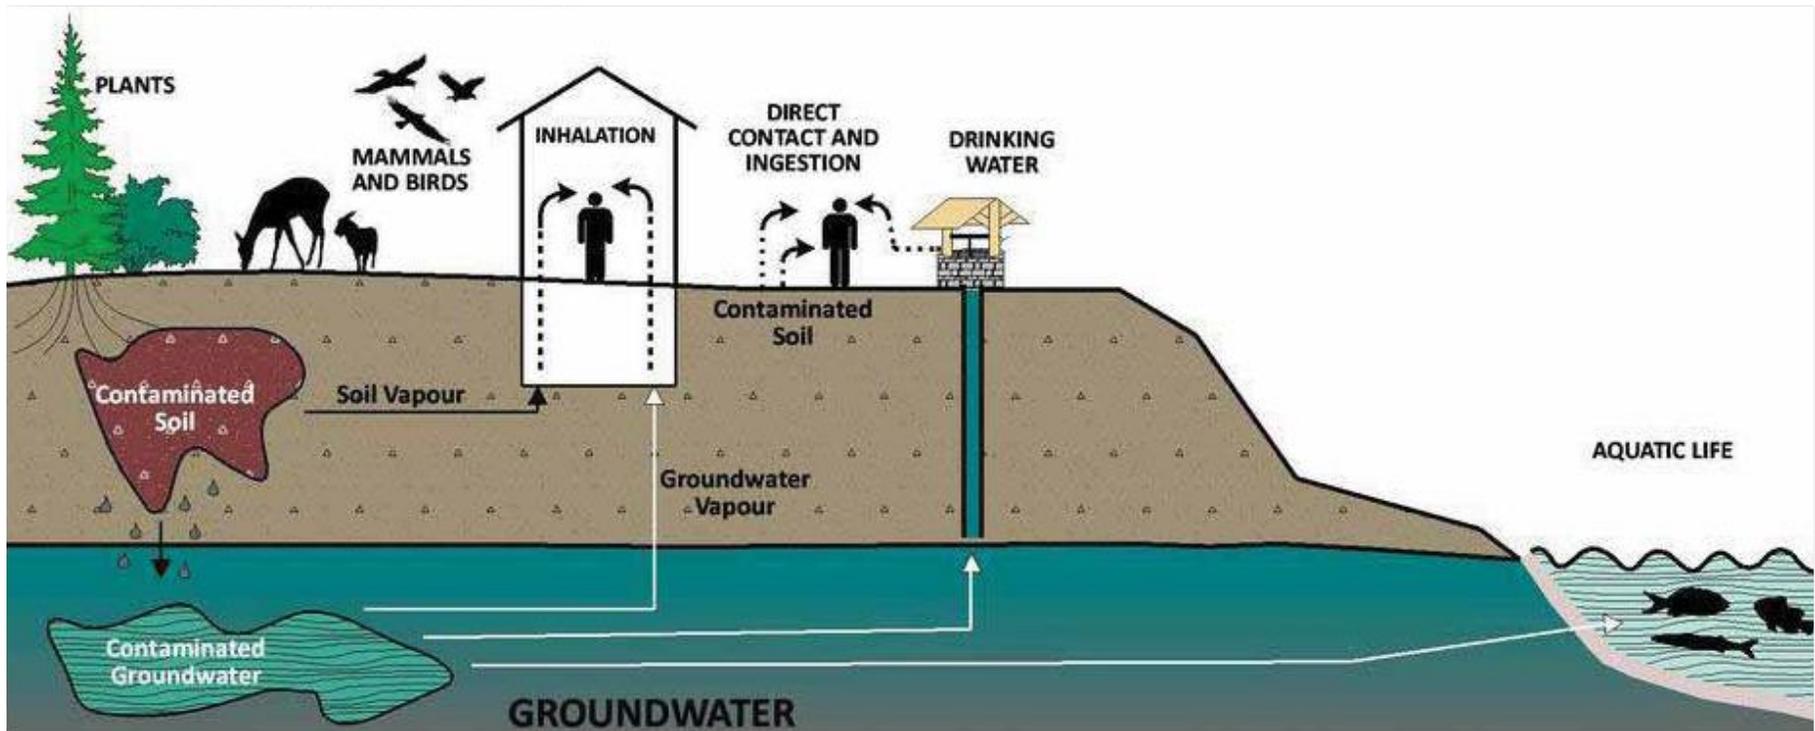

# Remediation Design

# Source-Pathway-Receptor Model

# Environmental Risk Assessment

**Hazard:** is the inherent potential for something to cause harm. Hazards can include substances, machines, energy forms, or the way work is carried out.

**Risk:** is the likelihood that harm will actually be done by the realization of the hazard during the work being carried out or by the way something is used.

$$\text{Risk} = \text{Hazard} \times \text{Exposure}$$

Likelihood	Consequences				
	Insignificant	Minor	Moderate	Major	Severe
Almost certain	M	H	H	E	E
Likely	M	M	H	H	E
Possible	L	M	M	H	E
Unlikely	L	M	M	M	H
Rare	L	L	M	M	H

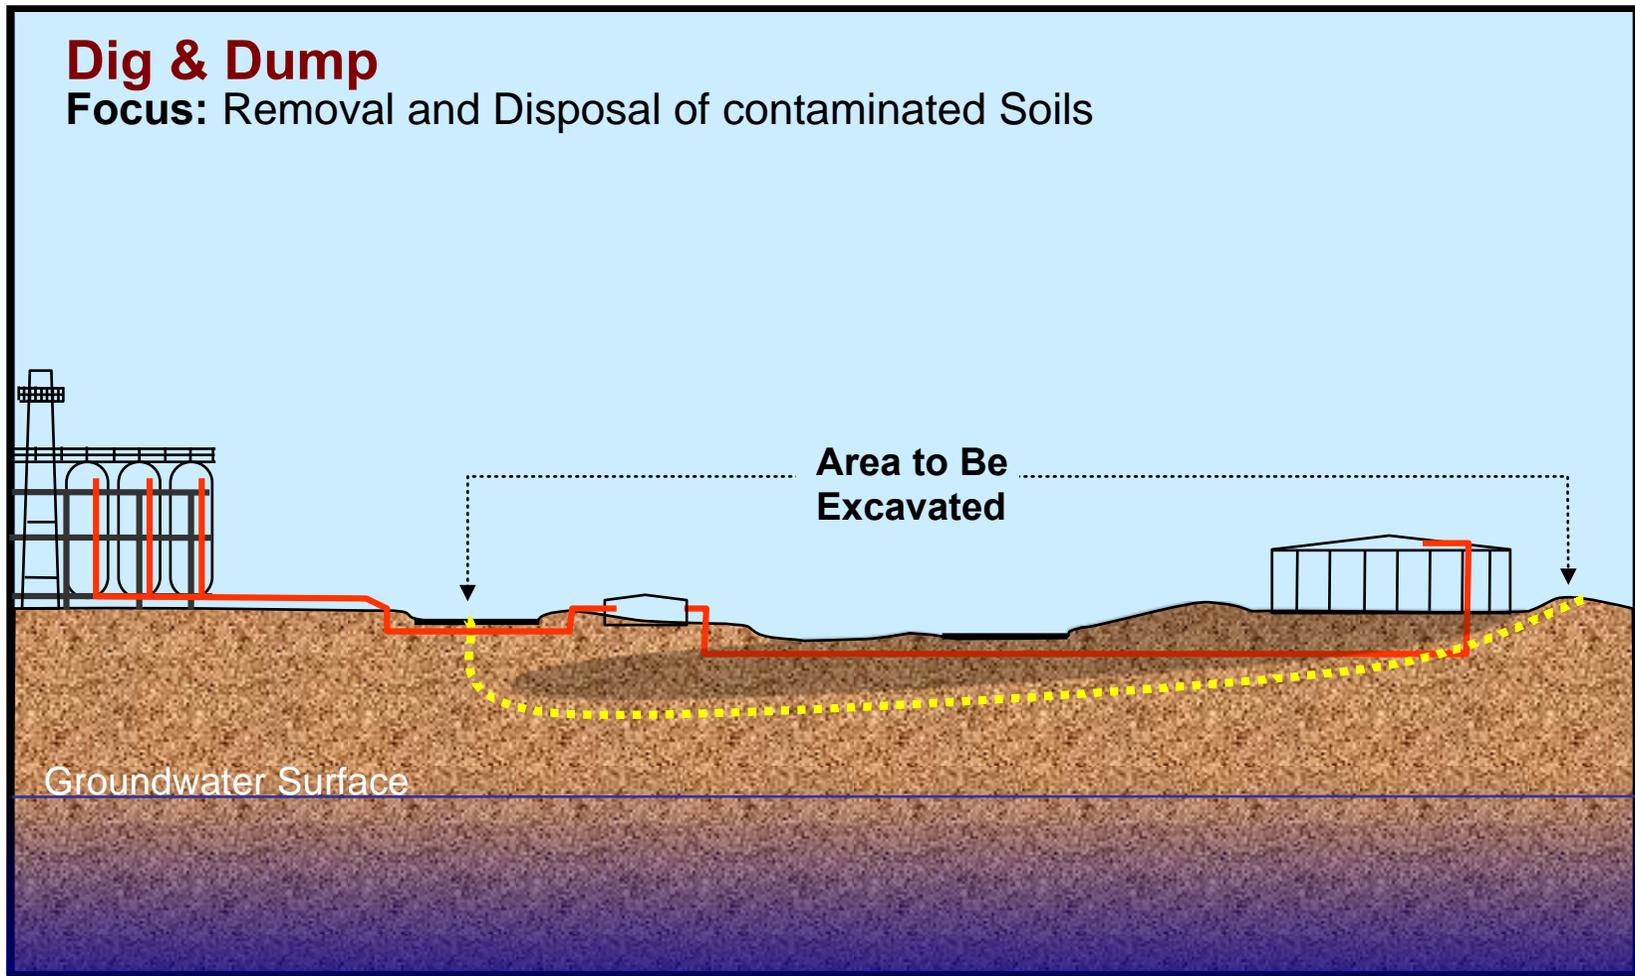

Standard Risk Matrix

# Remediation Strategies

## Dig & Dump

# Communication & Remediation

# Communication & Remediation

<b>C</b> larity	communicate clearly & respectful
<b>O</b> peness	be open and honest
<b>M</b> anagement	take full responsibility
e <b>M</b> otions	realize that is not just a technical issue
c <b>U</b> lture	take cultural and local differences into account
e <b>N</b> sure	ensure the well-being of the community
<b>I</b> nvolvement	involve stakeholders
<b>C</b> redibility	build-up trust before it is needed
pl <b>A</b> n	think ahead
<b>T</b> iming	be pro-active
<b>E</b> valuate	learn from mistakes made in other projects

# Urban Planning Pyramid

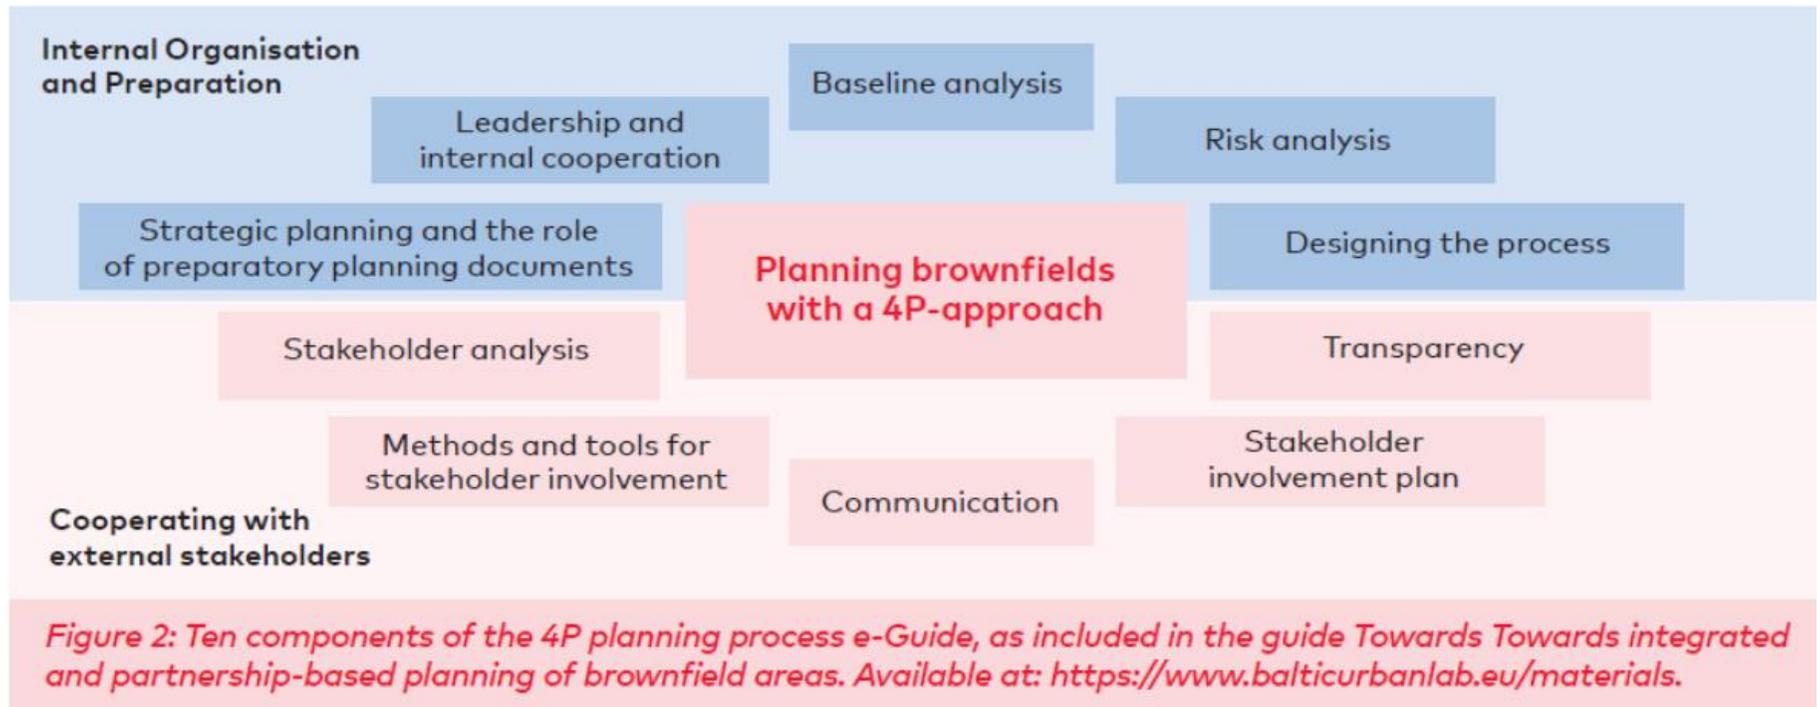

Close cooperation and partnerships between different actors from the beginning of the redevelopment process are key to tackling challenges.

Source: Based and elaborated on City of Oulu, Detailed planning Department (2013)

# Public-Private-People Partnerships

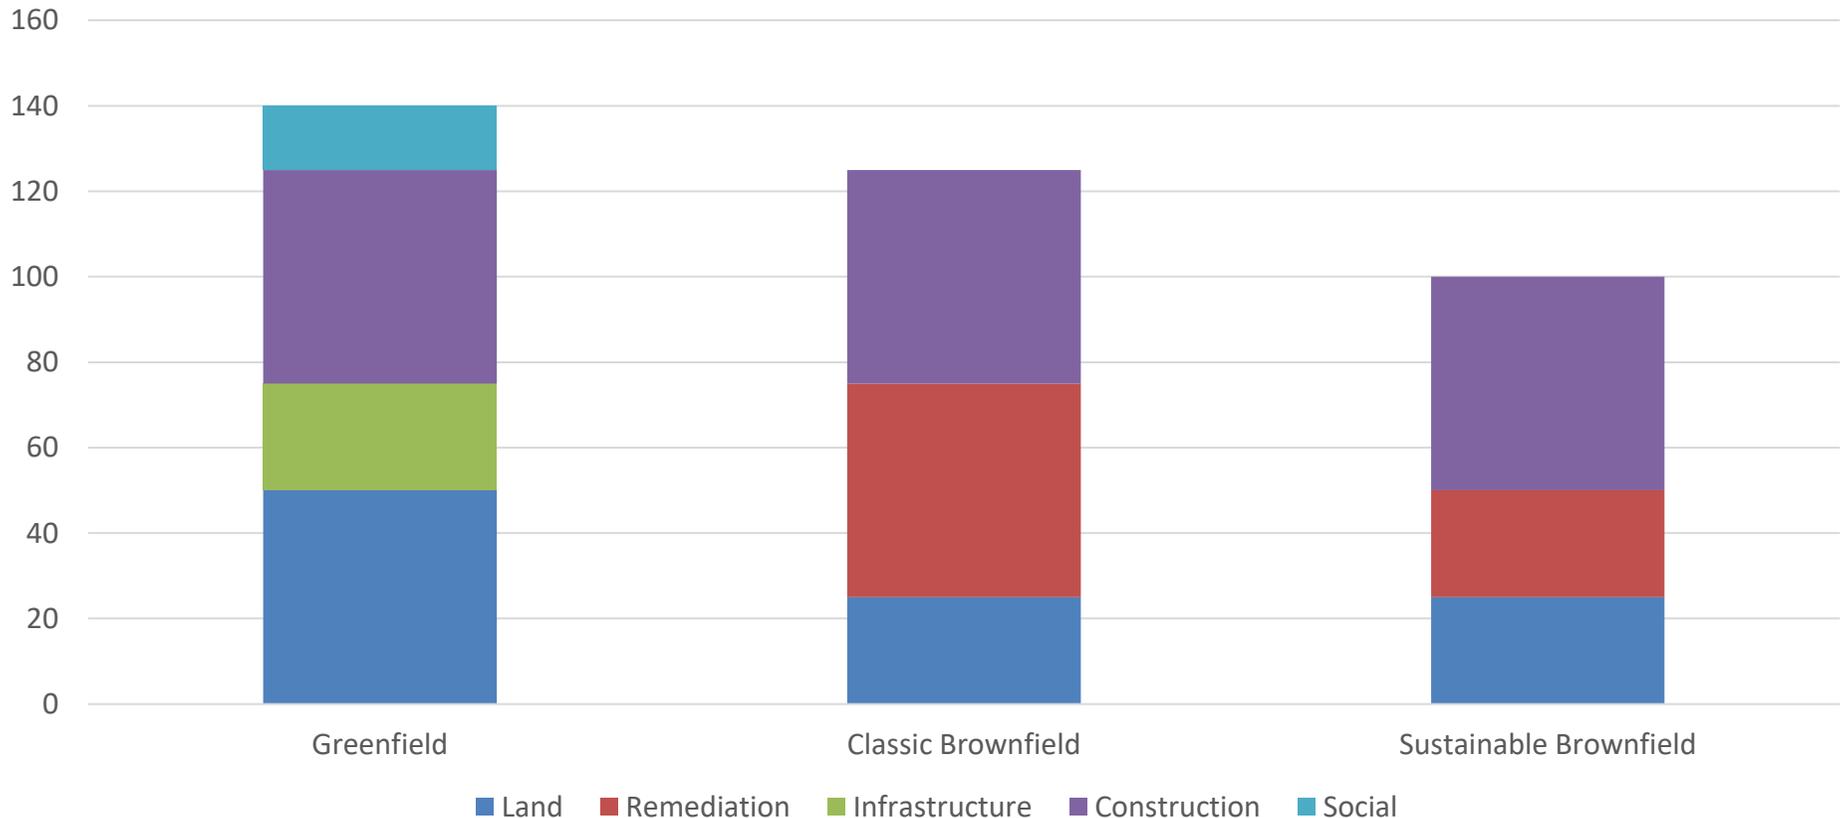

- Critique for Public-private partnerships for lack of transparency and handover of planning and design to private developers
- Adding the 4<sup>th</sup> P - people & offering them possibilities to participate
- In Baltic Urban Lab, Norrköping, Turku, Tallinn & Riga tested different 4P approaches for planning their brownfields sites
- Result → common vision & development plans for brownfield sites developed in cooperation with citizens and other stakeholders

# 10 Components of 4P Planning Process

# Conclusion

# Cost Elements Site Development \*)

\*) Conceptual model to depict cost comparison greenfield vs. brownfield

# Site Selection - Lessons Learned

- Research the site – know the challenges ahead of time
- Take the time to do proper site planning & design
- Design around the most difficult obstacles
- Get creative & think “Out of Box”
- Soil challenges can be easily & inexpensively overcome
- Think “Sustainability” – use what the site is giving to the greatest extent possible

# Benefits of Brownfield Redevelopment

- Reduce development of green fields
- Reduce threat to public health
- Air and water quality improvements
- Short- and long-term job creation
- Local economic growth and investment
- Surrounding property values increase
- Revitalization of tax revenue
- Increase tax base
- Efficient use of existing infrastructure
- Renewed use of existing commercial properties
- Neighborhood revitalization
- Reduce Urban Sprawl
